AccessLens Walkthrough

Step 1, open the demo

Step 2, load some data

Step 3, run the review

Step 4, read the simple summary

Step 5, switch to the analyst view

Step 6, try the clean example

Step 7, run it from the command line instead

What to do with the results

AccessLens Walkthrough

A short guide to actually using AccessLens, written for someone opening it for the first time. Every screenshot below is taken from the real, live demo.

Step 1, open the demo

Go to <https://ubaidraza5.github.io/accesslens>. Nothing needs installing, and no signup is required. The page explains itself, paste or upload an access export and the check runs entirely on your own screen.

The AccessLens homepage

Step 2, load some data

If you do not have an export ready to test with, use one of the two sample companies. Alderbrook Logistics has a full set of realistic, deliberately planted issues, useful for seeing what a problem report looks like. Brightfield Analytics is a clean company with nothing wrong, useful for seeing what a healthy result looks like.

To use your own data instead, either press Upload a CSV file and choose your export, or paste the CSV text straight into the box. See [USAGE.md](#) for the exact columns AccessLens expects.

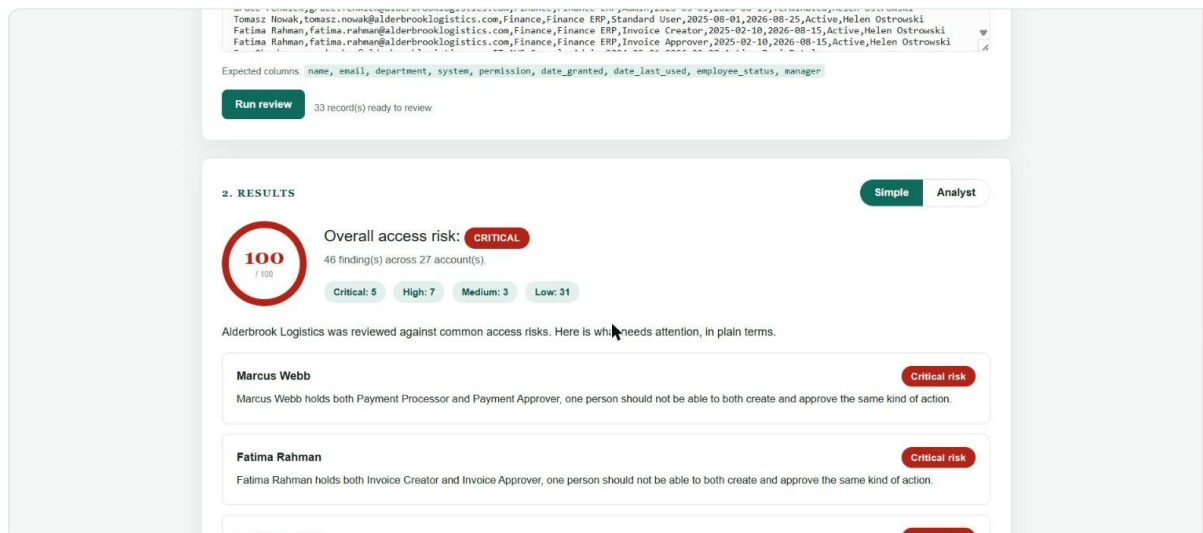

Loading the sample company data

Step 3, run the review

Press Run review. The results appear straight below, there is no waiting, the whole analysis happens instantly on your own device.

Step 4, read the simple summary

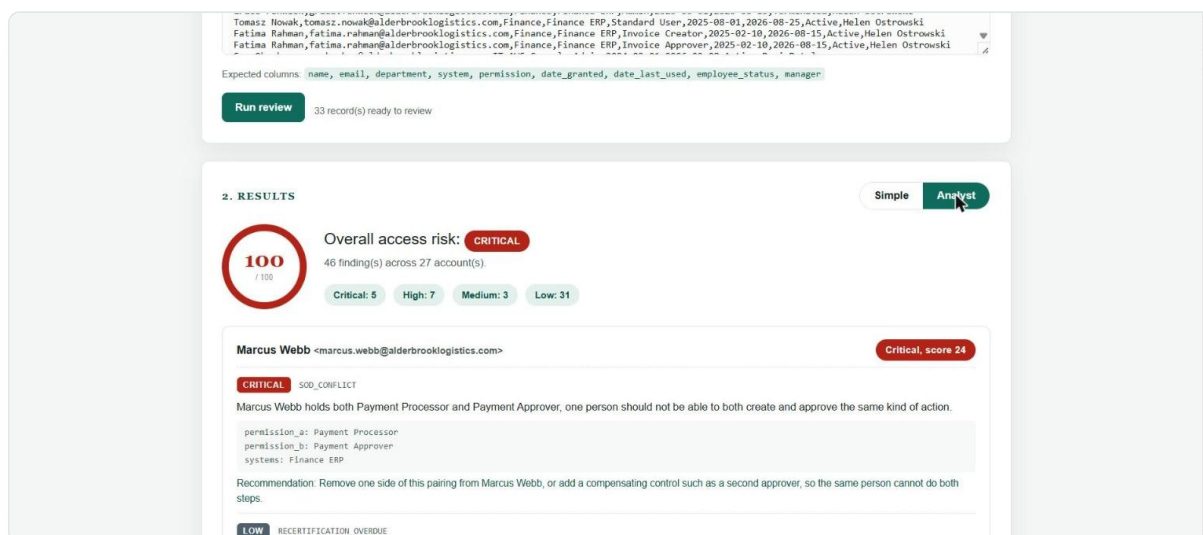

By default you land on the Simple view. This is written for anyone in the business, not just a security team. At the top is an overall score out of 100 and a risk level. Below that are the accounts that need attention first, each with a plain sentence explaining what is wrong.

The simple, plain language report

Step 5, switch to the analyst view

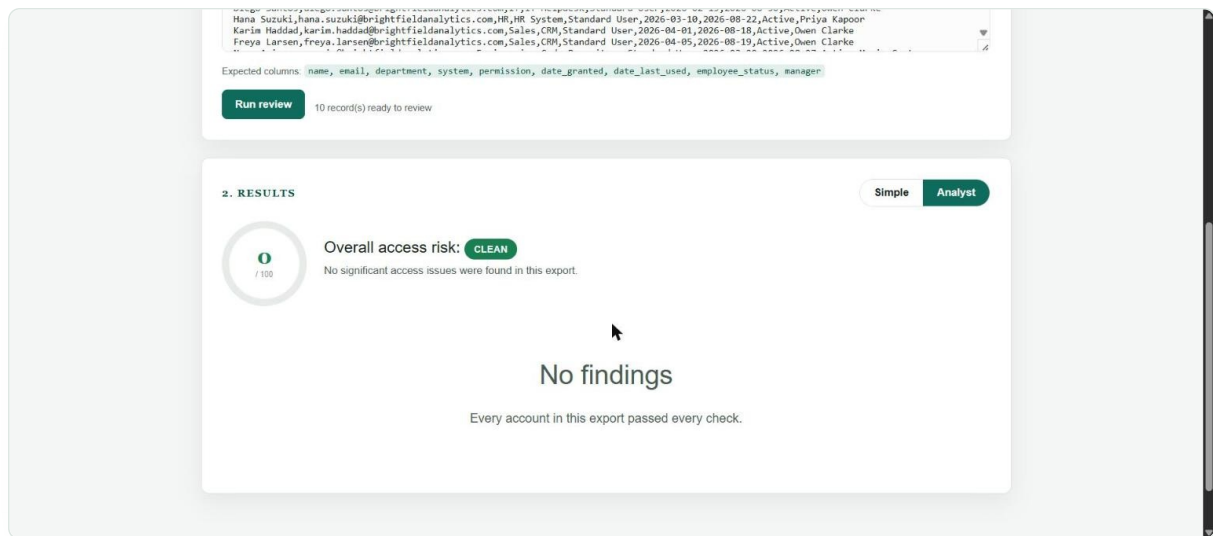

Press Analyst at the top right of the results panel to see the full technical breakdown, every finding for every account, with its severity, the evidence behind it, and a recommended next step. Company wide issues that are not tied to one person, like too many admins on a single system, appear in their own section at the bottom.

The analyst view with full evidence

Step 6, try the clean example

Go back to step 2 and press Load sample company (clean) instead, then run the review again. This shows what a well handled access setup looks like, a score of zero and a Clean result.

The clean sample company result

Step 7, run it from the command line instead

If you would rather run this as part of a script or a regular process rather than through the browser, the same engine is available as a Python command line tool.

```
python main.py your_export.csv
```

See [USAGE.md](#) for every option, including the analyst report, JSON export, and using AccessLens as a pass or fail gate in a pipeline.

What to do with the results

Start with anything marked Critical, these are the issues most reviewers would want fixed the same day, access left behind after someone left the company, or one person able to both request and approve the same action. High priority items are usually next, followed by the smaller cleanup items. Share the report, in Simple mode, with the manager listed against each account, since they are usually the person who can confirm whether the access is still needed.
